Overview

Welcome to the South Carolina Farm to School February Nutrition Education Lesson. This lesson contains information & hands on activities where 6-8 students will be learning about plants and how components in nature interact with each other in ecosystems. Our goal for this lesson is to help children explore the connection between food production and ecosystems interactions.

These lessons are designed to be delivered over a four week period, noting that introduction & activities will be supplemental to existing curriculum.
Estimated Total time: 70-90 minutes

Teacher Background

Most plants and animals live in areas with very specific climate conditions, such as temperature and rainfall patterns, that enable them to thrive. Any change in the climate of an area can affect the plants and animals living there, as well as the makeup of the entire ecosystem. Some species are already responding to a warmer climate by moving to cooler locations. For example, some North American animals and plants are moving farther north or to higher elevations to find suitable places to live. Climate change also alters the life cycles of plants and animals. For example, as temperatures get warmer, many plants are starting to grow and bloom earlier in the spring and survive longer into the fall. Some animals are waking from hibernation sooner or migrating at different times, too.

Plants and animals have adapted to changes in the environment for millions of years. However, today's changes are happening faster and on a larger scale than in the past, which makes it difficult for plants and animals to adapt. Changes in climate can affect the types of plants that can grow in an area. Animals' food supplies, water, life cycles, breeding habits, and ranges will be affected, too. Some animals will adapt to changing conditions or move elsewhere, but others could have trouble surviving. Some unwelcome invaders (invasive species) could benefit from climate change by expanding their range or being able to survive through the winter in new places. All these changes will affect the way ecosystems function, and changes to ecosystems affect people, too. That's because we rely on ecosystems to provide us with many services, like clean water, food, and medicines.¹

It is easy to forget that food is a product of ecosystems. We usually purchase it in supermarkets and restaurants, where it bears little resemblance to the original plant or animal. Yet, without sunlight, soil, water, plants, and animals interacting in an ecosystem, we would have no food.

Food gives us the energy we need to stay alive, grow, and reproduce, and we can get this energy only from other organisms. Although the sun emits enormous quantities of radiant energy every day, our bodies cannot use it directly. Instead, we rely on plants to convert it to chemical energy (food) through photosynthesis. This energy may then pass through a food chain to us. Photosynthesis, pollination, predation, decomposition, the cycling of nutrients, and water are all involved in creating our food.

Although farms and gardens depend on ecosystem processes, they are different from natural ecosystems. Natural ecosystems contain plant and animal populations interacting in balance with one another and nonliving things, and can sustain themselves over time. In farms and gardens, people plant seeds, add water, amend the soil, weed, and remove pests to increase production, all of which can affect both balance and sustainability.
As seen in Nourish, these human impacts are often far-reaching, especially with industrial agriculture. For example, pesticides and fertilizers applied to industrial farms in the Midwest have created a dead zone—where almost nothing can live—thousands of miles away in the Gulf of Mexico.²

¹ Adapted from: A Student’s Guide to Global Climate Change (http://www.epa.gov/climatechange/kids/impacts/effects/ecosystems.html)

² Adapted from: Nourish Life (http://www.nourishlife.org/pdf/Nourish_Curriculum_Guide.pdf)
Lesson checklist

**F2S Aim:** Explore the connection between food and ecosystems interactions.

**F2S Objectives**

* Students will be able to:
  - Explain the term “ecosystem”.
  - Discuss the role that plants play in nature (food chains, food webs, ecosystems).
  - Demonstrate understanding of the components and interactions of an ecosystem (i.e. process of food production).
  - Observe components and interactions of a local ecosystem (i.e. school garden).
  - Taste the Palmetto Pick of the Month (winter squash).

**Materials:**

- Copies of ecosystem hunt worksheet (Appendix A)
- Farm to School Planting Sheet (Appendix B)
- Plant Guide (Appendix C)
- Winter Squash Power Point (Appendix D & will be sent electronically)
- Pencils or clipboards
- Index cards or rings
- References materials of ecosystems
- Grocery list: 1 spaghetti squash, olive oil, parmesan cheese
- Kitchen Supplies: cutting board, knife, oven mitts, fork, paper plates & forks to serve/eat squash
- Gardening Journal
- Family Activity Sheet (Appendix E & in Dropbox)
- Copies of the February Farm to School Lesson Assessment (in Dropbox)

**National Health Education Standards**

Let’s Learn!

What is an ecosystem?\(^1\)
Estimated Time: 15 minutes

1. Review with the students what they have learned about food chains (This topic was introduced in the “November Farm to School Lesson: All about Food Plants”).
2. Point out that most often when we imagine a food chain, we are thinking about one that includes green plants and animals that depend on these plants. If necessary, review the plant parts (roots, stems, leaves, flowers, fruits, and seeds) learned in the Farm to School November lesson.
3. Next introduce the concept of ecosystem with the following discussion questions:
   - Can anyone tell me what an ecosystem is?
   - What is the difference between a food chain and an ecosystem?
   - What elements make up an ecosystem?
   - Can anyone think of interactions that take place in an ecosystem that make it possible for an organism to survive?
   - What are some of the living or biotic, factors in a field ecosystem?
   - What are some of the nonliving or abiotic, factors in a field ecosystem?
   - What other conditions affect plant life? (weather, temperature, water)
   - Can you think of a plant and some of the conditions it needs to be able to survive and grown in an ecosystem? If these conditions don’t exist, what happens to the plant?
   - What are the conditions that change in the spring, summer, fall and winter? Do these conditions affect the plant life? How?
4. If students are struggling with the concepts of ecosystem, biotic and abiotic interactions, you may wish to review these terms as a class.

Activity

Ecosystem exploration project\(^2\)
Estimated Time: 25 minutes

1. Challenge your students to assess ecosystem components and interactions in the school garden.
2. Give students copies of the Ecosystem Hunt worksheet (Appendix A). Review the terms and have students provide some possible examples for each. Also review expected behavior for working outside.
3. Take the class to the garden and have students work in pairs to conduct the hunt. As they are working, circulate among them to check in on their findings and to answer any questions.
4. Bring the group together, and ask pairs to share some of the evidence they have collected. Discuss what they learned from the hunt:
   - What evidence did you find for the various ecosystem components and interactions?
   - In what ways do garden plants—and people—depend on each of these elements?
   - Considering the evidence, how healthy would you say this garden ecosystem is?
   - How is the garden ecosystem different from a natural ecosystem?
   - How do growing food and raising livestock affect the surrounding ecosystem?
   - If we were to conduct the same hunt on an industrial farm, what differences might we observe?
5. Explain to students that they will use their evidence from the hunt to create an illustrated, self-guided tour of the garden for faculty, staff, students, and visitors, emphasizing its similarities to a natural ecosystem. The tour may consist of cards on a ring or a booklet, with each card or page focusing on one of the ecosystem components. You may choose to have students work in groups or individually.
6. Make clear that for each component, students should include the name of the component or interaction, add a brief description of what it is and where it can be found in the garden, and illustrate it with a garden example. The first card or page should also provide a brief overview of the garden as an
ecosystem. Have reference materials on hand so that students can refer to them as they create their tours.
7. After they have completed their tours, give students an opportunity to share them with other students in the school.

★ Gardening Activity

Preparing the Spring Garden
Estimated Time: 15-30 mins
Materials Needed:
Farm to School Planting Sheet (Appendix B)
Plant Guide (Appendix C)

Note: This activity is designed to help the school prepare for Spring planting in their Farm to School raised beds/in-ground gardens. Because schools are implementing lessons at different levels, please consult with the Farm to School Team at your school about the direction the school would like to take for planting the garden before doing this activity.

1. Review with the class the purpose of the school garden.
2. Explain the purpose of this activity is to design how the school garden will be planted. Take a few minutes to watch the following video:
   http://www.youtube.com/watch?v=a-WMWISI12s
   It will discuss considerations when designing your garden such as water and sun access.
3. Next, review the produce that grows successfully in SC in the Spring. See Appendix C for more information. Decide which plants you would like to grow. Remember to look at the plants that will be most successful in your region of the state. For additional information about growing in SC regions, please visit http://www.clemson.edu/extension/hgic/plants/vegetables/gardening/hgic1256.html.
4. Use the Farm to School Planting Sheet (Appendix B) to design where your seeds/plants will be planted in your raised beds. Think about height of plants, width of plants, varieties of plants, etc. Do not forget to visit your raised beds with your students and take pictures of the raised beds prior to planting. Have your students envision how the garden will look. Have them record in their garden journal predictions on how quickly the plants will grow. Monitor this and write about it throughout the Spring till harvest.

You can also divide the class into groups and each group will monitor and journal about different aspects of the school garden. Groups can journal about how each of these affect the garden: weather, sun, water/rain, etc.

★ Palmetto Pick Activity

Noodle Mania!
Estimated Time: 15-20 mins
1. Have students wash their hands (with soap & warm water for 20 seconds) & reinforce that it is important. Show the students that you have washed the spaghetti squash before beginning.
2. Display the Winter Squash power point (will be sent electronically-Appendix D) while you are preparing the spaghetti squash.
3. Cut spaghetti squash in half. Scrape out the seeds or select two-three students to help scrape out the seeds.
4. Steam the squash in the microwave, rind side up, for six to eight minutes. *Be careful removing the squash, it will be hot. Wear oven mitts.
5. Separate strands with a fork. When finished, toss with olive oil and parmesan cheese.
6. Serve a 1 oz. portion for each student to taste.

Ingredients:
1 spaghetti squash
Olive Oil (to taste)
Parmesan Cheese (to taste)

Encourage students to discuss the “noodles” of the spaghetti squash. Record on the board some of their perceptions of the spaghetti squash:
• Did it taste like they thought it would taste?
• Does it taste like noodles?
• Is it fun to eat like spaghetti?
**Note:** One spaghetti squash should yield roughly 40 oz. of “spaghetti”. If you are serving more than 30 students, add additional spaghetti squash. The squash will be very hot, please use caution and wear oven mitts. Spaghetti squash are hard, you may want assistance in cutting the squash and/or you may want to have it cut before you begin the PPM Activity.

---

**Evaluation**

**Formal Assessment:**
1. Use students’ self-guided tour to assess the various ecosystem components and interactions in the garden. As an alternative assessment, students could create a poster showing the components and processes of the ecosystem as a whole.
2. **Optional resource:** Administer the [Farm to School February Lesson Assessment](#) to your students (the electronic copy is in Dropbox). If you decide to use this assessment with your students, please let us know because we would like to summarize any information collected.

**Informal Assessment:** Observe participation in lesson activities. Complete survey at end of month (survey will be sent electronically).

What to Plant

Seeds can be started indoors between January and February and will need to be transplanted to your garden at a later time. Some vegetables, however, can be planted straight from the seed such as beans, beets, cantaloupe, carrots, corn, cucumbers, lettuce, okra, peas, pumpkins, and spinach. If you choose to grow vegetables that you will be able to harvest in a short amount of time, lettuce can be grown in 25 days and radishes can be grown in 45 days. Beets, broccoli, beans, or spinach will mature in 50 days. Additional vegetables and their corresponding planting ranges are listed in the following tables:

Warm Season Vegetables – Plant these in the spring to harvest before school is out for summer

<table>
<thead>
<tr>
